Assignment 3

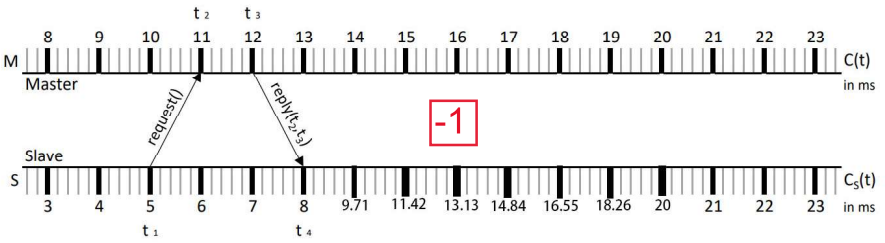
Ciheng Zhang (3472321)
Chenxi Li(3502796)
Yaosheng Zheng (3563285)
Leqi Xu(3556962)

6/16

1 Physical Clocks

You should get values that are integers because float values in this scenario aren't possible

4.5/8 a)



-0.5 O = 5

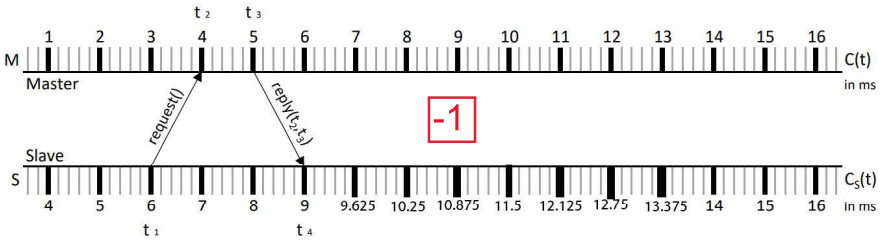
-0.5 d = 7

Δ = 7 $C_i(t_4+\Delta)$ = 20

$\frac{dC_s}{dt} = \frac{7+5}{7} = 1.71$ in time interval $(C_s(t_4), C_s(t_4+\Delta)]$

d should be 1,
Delta should be 1,
afterwards there are follow up errors.

b)



O = -3

d = 1

-0.5 Δ = 8 $C_s(t_4+\Delta)$ = 14

$\frac{dC_s}{dt} = \frac{8-3}{8} = 0.625$ in time interval $(C_s(t_4), C_s(t_4+\Delta)]$

Delta should be 4,
afterwards there are follow up errors.

1.5/8 c)

i.send two request and get two reply. Then calculte by this two time.

1.5/3

$$\frac{t_7 - t_3}{t_{15} - t_{10}} = 0.8$$

Do you want to calculate:
(t7-t3)/(t8-t4)=(9-6)/(15-10)=0.6
and confused the value and the indice of t?

Ciheng Zhang (3472321)
Chenxi Li(3502796)
Yaosheng Zheng (3563285)
Leqi Xu(3556962)

ii.

8/10

2 Logical Clocks

a)

0/2 i.

$$e_1^1, e_3^1, e_1^2, e_1^3, e_2^1, e_3^2, e_2^2, e_3^3, e_2^3, e_1^4, e_2^4, e_3^4$$

3/3 ii.

$e_1^1 = (1,0,0), e_3^1 = (0,0,1), e_1^2 = (2,0,1), e_1^3 = (3,0,1), e_3^2 = (0,0,2), e_3^3 = (0,0,3),$

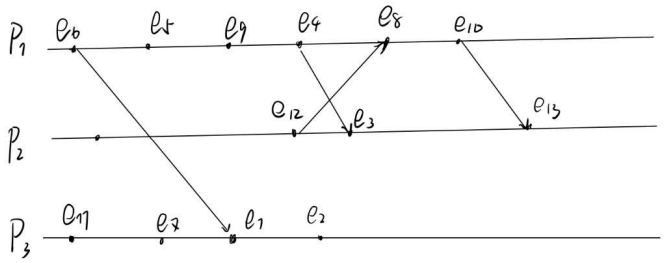
$e_2^1 = (3,1,1), e_2^2 = (3,2,1), e_2^3 = (3,3,3), e_2^4 = (3,4,3), e_1^4 = (4,0,1), e_3^4 = (3,4,4)$

1/1 iii.
e_1^4. By the vector Clocks. $e_3^4 = (3,4,4)$. Thats mean all the events from P2 and P3 is related. Only one event form P1 is not related. e_1^1, e_1^2, e_1^3 is contributed to e_3^4 by $e_1^3 -> e_2^1$. So only e_1^4 is not related.

b)

2/2

2/2



9.5/10

3 Global State

4/4 a)

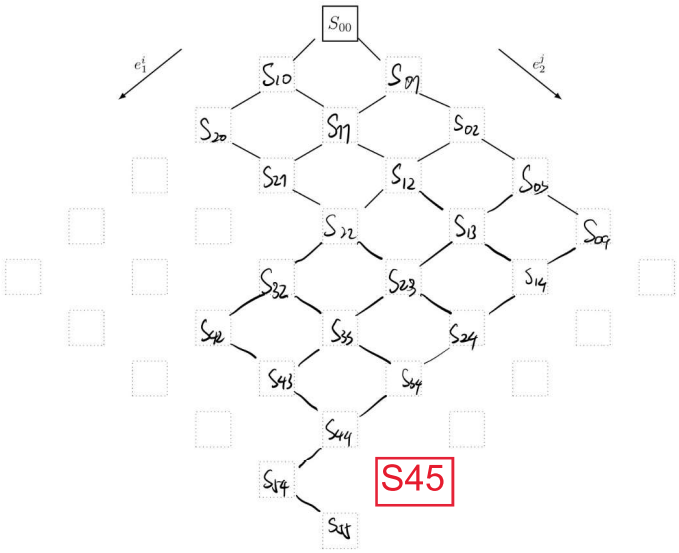
$$(e_1^1||e_2^1), (e_2^2||e_1^2), (e_1^1||e_2^2), (e_2^2||e_1^2), (e_1^1||e_2^3), (e_1^1, e_2^4), (e_1^2||e_2^3), (e_1^2||e_2^4), (e_2^3||e_1^4)$$

1/1 b)

i.Linearization. All the event is follow the rule happend-before.
ii. No Linearization. $e_2^4 -> e_1^5$ is not follw thw rule happend-before.

Ciheng Zhang (3472321)
Chenxi Li(3502796)
Yaosheng Zheng (3563285)
Leqi Xu(3556962)

4.5/5 **c)**



6/6

4 Snap Algorithm

4/4 **a**

2/2
